Composite Wood Products ATCM

This page last reviewed August 13, 2012

Formaldehyde is produced on a large scale worldwide. One major use includes the production of wood binding adhesives and resins. The Air Resources Board (ARB) evaluated formaldehyde exposure in California and found that one of the major sources of exposure is from inhalation of

formaldehyde emitted from composite wood products containing urea-formaldehyde resins. The International Agency for Research on Cancer (IARC) reclassified formaldehyde from "probably carcinogenic to humans" to "carcinogenic to humans" in 2004, based on the increased risk of nasopharyngeal cancer. Formaldehyde was also designated as a toxic air contaminant (TAC) in California in 1992 with no safe level of exposure. State law requires ARB to take action to reduce human exposure to all TACs.

Staff of the ARB conducted a formal rulemaking process to address formaldehyde exposure from composite wood products. On April 26, 2007, ARB approved an airborne toxic control measure (ATCM) to reduce formaldehyde emissions from composite wood products including hardwood plywood, particleboard, medium density fiberboard, thin medium density fiberboard (thickness ≤ 8mm), and also furniture and other finished products made with composite wood products. The ARB's April 26, 2007 Board Presentation is available.

The ATCM to control formaldehyde emissions from composite wood products was approved on April 18, 2008, by the Office of

A colorful
palette
full of
possibilities.

Image shown: Maple, No. 1041™ in Cabot distributed with SoundCheck™ in Cabot.

SOUND CHECK™

Close cropped cut pile with energetic lines of color made in a light stripe design. Looks best with squares installed in a parquet style (quarter turn). 100% recycled Nylon face fibers. Made in the USA.

\$10.00 per tile

please note: This style features a random stripe pattern designed to vary from square to square, so stripes will not align at edges. Each tile is unique. Not all variations may be shown in photographs.

Rapidly Renewable

TILE

Handmade cement tile

Villa Lagoon's handmade encaustic cement tiles show surface imperfections, chipped edges, and color variations, and they're softer than either ceramic or porcelain tiles fired in a kiln. In company owner Lundy Wilder's view, that helps to make them unique works of art that can't be matched by factory-made ceramic tiles.

The tiles have a color layer—made from ground marble dust, portland cement, and earth pigments—which is bonded to a cement-and-sand substrate using pressure. Tiles are available in stock and custom patterns (VillaLagoonTile.com). Thicknesses range from 1/4 in. to about 3/8 in., sizes are from 4 in. to 12 in., and pricing is between \$12 and \$20 per sq. ft. They weigh about twice as much as standard porcelain tiles (one 8-in. tile weighs about 3 lb.), and the manufacturer recommends that they be sealed after installation. When properly installed and sealed, tiles are frostproof, the company says.
