Aerosols - Seek and Seal Envelope Leaks

Dave Bohac PE | Director of Research Ben Schoenbauer | Senior Research Engineer Jim Fitzgerald | Senior Building Analyst

Center for Energy and Environment

2017 Energy Design Conference

• Credit

In accordance with the Department of Labor and Industry's statute 326.0981, Subd. 11,

"This educational offering is recognized by the Minnesota Department of Labor and Industry as satisfying **1.5 hours** of credit toward **Building Officials and Residential Contractors** continuing education requirements."

For additional continuing education approvals, please see your credit tracking card.

• What We Do

- Energy Program Design & Delivery
- Engineering Services
- Lending Center
- Public Policy
- Innovation Exchange
 - Research
 - Education and Outreach

Multifamily Experience

- Facility assessments of over 2,000 buildings in Minnesota
- Completed over 20 research projects

Current Multifamily Research Projects

PROJECT

ANTICIPATE FINDINGS

- Condensing boiler optimization
- Multifamily ventilation optimization
- Multifamily aerosol envelope air sealing
- Indoor pool optimization
- Demand controller recirculation loop

Available Available Available soon Mid 2017 Mid 2017

Case studies of high efficiency through-wall furnaces CenterPoint Energy (2017)

Multifamily Envelope Sealing Opportunity:

- **Existing.** Thousands of leaky units built before any tightness requirements.
- New Construction.
 - Lowrise moderately tight with ventilation.
 - Highrise limited tightness requirement.

Benefits:

- Reduced air infiltration energy costs
- Reduced odor transfer & improved IAQ
- Improved comfort from reduced drafts
- Reduced noise transmission (neighbors and outside)
- Improved envelope durability
- Reduced stack effect

• Envelope Sealing Challenges:

- Existing buildings. No/difficult/costly access to distributed air leaks. 10% to 25% reduction is challenging.
- New Construction. Single family approaches only recently starting to carry over to multifamily buildings. How can we do this more effectively for both exterior leakage and compartmentalization?

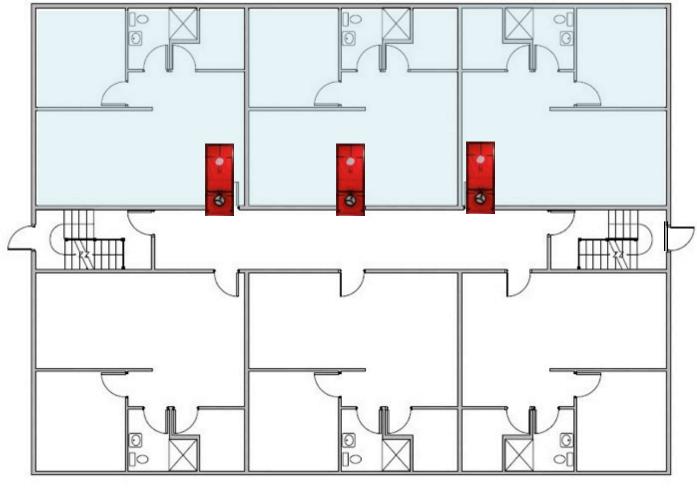

Building Tightness Specification:

- Leakage: cfm50 or cfm75. Measure the air flow rate needed to pressurize and/or depressurize the building by 50Pa (0.2 in. wc.) or 75Pa (0.3 in. wc)
- Normalized leakage. Divide leakage by building volume or envelope area
 - ACH50. 60*cfm50/volume
 - cfm50/sf or cfm75/sf.
 building envelope area = exterior walls + roof + floor (6 sides)

Apartment Building Test Options:

Guarded Test: Interior Leakage

Source: Paul Morin, TEC

Apartment Building Test Options:

Whole Building: Exterior Leakage

Source: Paul Morin, TEC

Envelope Tightness Requirements:

- Minnesota Energy Code (2015).
 - SF and 1 to 3 story MF: 3.0 ACH50
 - 4+ story MF: 0.4 cfm75/sf

typically met by either **Materials** (0.004 cfm75/sf) or **Assemblies** (0.04 cfm75/sf) prescriptive options

 Green Communities (MHFA). EPA ENERGY STAR for multifamily high rise = 0.3 cfm50/sf (4 – 8 ACH50).

• LEED v4 Envelope Tightness: Energy

| | Homes & Lowrise (1 – 3 Story) | Midrise (4 – 8 Story) | Highrise (9+ Stories) |
|--------------|---|--|---|
| Prerequisite | 3.0 ACH50 | 0.3 cfm50/sf* or Air Sealing Checklist | Continuous air barrier |
| EA Credit | Air Infiltration | Annual Energy Use | Optimize Energy Performance |
| Points | 1: 2.75 ACH50 or 0.125 cfm50/sf 2: 2.50 ACH50 or 0.0925 cfm50/sf | 1 pt/% reduction Base= 0.40 cfm75/sf Requires leakage testing | 1 pt/2% reduction Base= 0.40 cfm75/sf Requires leakage testing |

* - Commissioning: Energy Star High Rise Testing & Verification, total leakage

Center for Energy and Environment To minimize waste of energy caused by uncontrolled air leakage into and from conditioned spaces.

• LEED v4 Envelope Tightness: Environmental Tobacco Smoke

- MF Midrise and Highrise. None.
- Highrise (9+ Stories).
 - Prerequisite: 3.0 ACH50
 - EA Credit: Air Infiltration (exterior leakage, zone 5-7)
 - 1 pt: 2.75 ACH50 or 0.125 cfm50/sf
 - 2 pt: 2.0 ACH50 or 0.0925 cfm50/sf

To prevent or minimize exposure of building occupants, indoor surfaces, and ventilation air distribution systems to environmental tobacco smoke.

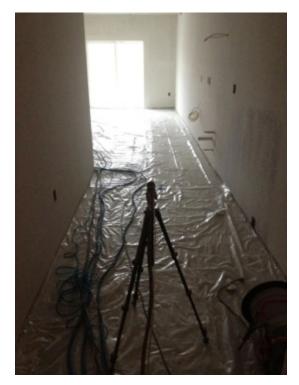

Envelope Aerosol Sealing

- Pressurize apartment
- Spray air sealing fog
- Sealant particles build up on gaps as they flow through the leaks

Similar to process used for aerosol duct sealing

Center for Energy and Environment

How does it do that?

No, really?

(animation video here)

Sealant is a synthetic acrylic – typically rolled or sprayed on for monolithic exterior air barrier. Diluted for aerosol application.

Sealant is low VOC: GREEN Guard Gold Certified for use in California school and health care facilities.

• Benefits:

- Automatically finds and seals leaks
- Very effective at sealing small, diffuse leaks
- Reliably meet air tightness requirements
- Simultaneous air leakage testing documents results
- Potential savings for avoided conventional air sealing (?)

Study Objectives:

Demonstrate sealing capability and evaluate commercialization

- Refine sealing technique measure leakage and noise transmission reduction & identify sealing locations
- How to incorporate into sealing strategy preseal "large" leaks and protect horizontal surfaces as necessary
- Time estimates
- Model energy savings and effect on ventilation
- 1. Sealed 18 units in 3 new construction buildings
- 2. Sealed 9 units in 3 existing buildings

• Aerosol Sealing Process:

All In One Visit

- 1. Walk thru to identify pre-sealing & protection requirements (prior to sealing visit?)
- 2. Pre-seal large gaps & temporary sealing as necessary
- 3. Site work prep cover horizontal surfaces
- 4. Set up sealing equipment
- 5. Perform sealing

Center for Energy and Environment

- 6. Remove coverings
- 7. Clean surfaces (if necessary)
- 8. Post-sealing air leakage test

9. Air leakage test when unit finished?

|-------------------------|-----------------------|----------------|-------------------|
| Floors | Tub or shower | Ceiling Fans | Top surface of |
| | surrounds and floors | | baseboard heating |
| Window sills | Toilets, sinks, other | Light switches | |
| | bathroom pieces | | |
| Window meeting rail and | Plumbing fixtures | Light fixtures | |
| muntins | | | |
| Door tops and hardware | Sprinkler heads | | |
| Top surface of | | | |
| baseboards, trims, and | | | |
| molding | | | |
| Horizontal surfaces of | | | |
| cabinets and built-ins | | | |

Temporary seals & covers: 3 to 7 hours/unit

Site Work:

Set-up, Seal & Breakdown

- Blower door and nozzles
- 100Pa pressurization
- ~ 90% RH maintained
- Open windows & purge
 6 to 7 hours/unit

Remove Covers & Pack-up

- Care to not disturb seals
- Minimal clean-up

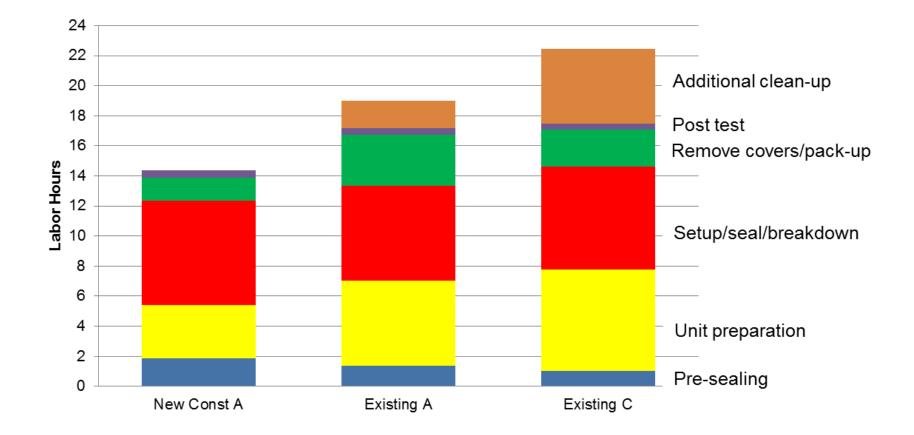

1.5 to 3.5 hours

Site Work Prep: how long does it take?

14 – 22 hours: still learning

Site Work Prep: reduce time

Opportunities to reduce labor time

- Pre-sealing: new construction GC or sub completes
- Unit preparation: select time during construction when
 - Minimum horizontal surfaces to protect
 - Leaks are accessible
 - Seals will be durable
- Sealing time: new generation of more portable equipment is being developed & stop when no longer cost effective
- Breakdown/clean-up: minimize surfaces to cover and better positioning of spray nozzles

Exterior is 5x leakier than interior

Reduced Noise Transmission

- Sound transmission testing was conducted in a MF building in NY
- Protocol based on ASTM E90
- Seal was an effective sound barrier between 800-5000 Hz
- Human voice frequency falls between 300-3000 HZ
- Helps to meet Building Code (IBC) requirement of 50 STC

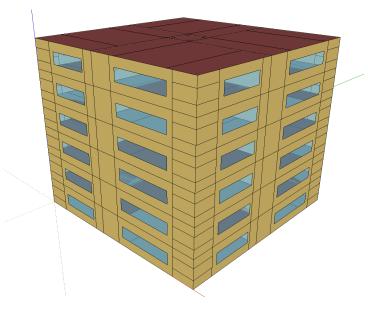

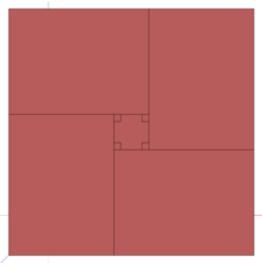

- Ventilation model: Airflow network
 - Calculates inter-zone flows
 - Accounts for wind and stack effects
- HVAC Equipment:
 - Based on MN multifamily building stock
 - Heating provided by baseboard radiant heaters
 - Cooling provided by window air conditioners

Model - Construction

- 6-Story building model
- Floor plan:
 - 4 Units per floor
 - 1 Elevator shaft
 - 1,200sf floor area
- Construction:
 - DOE reference model construction
 - Window to wall ratio: 20%

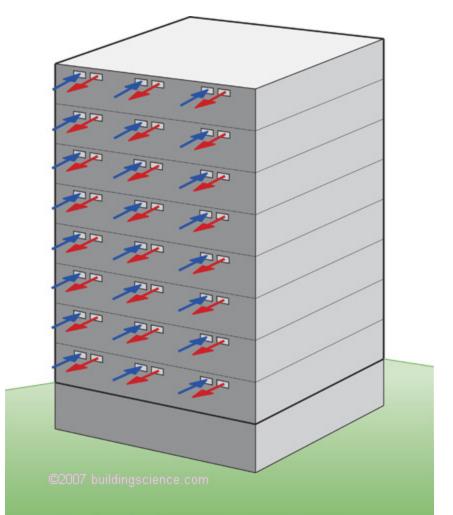

Model – Ventilation Method

- Four ventilation strategies investigated
 - Exhaust only
 - Exhaust with some supply
 - Balanced
 - No ventilation
- Individual unit exhaust fans and balanced ventilators

Model – Leakage

Envelope leakage (total):

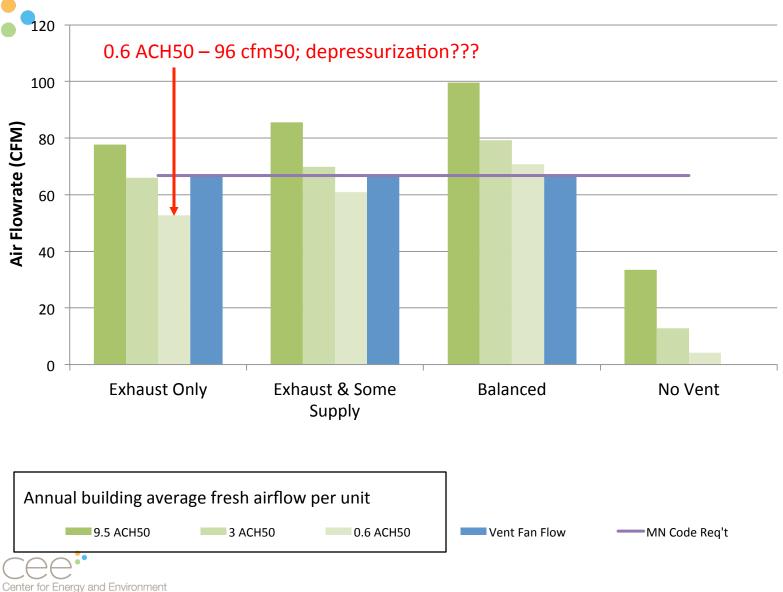

- Existing Building
 - Leaky: 9.5 ACH50 (existing data)
 - Sealed: 3 ACH50 (MN code?)
- New Building
 - Compliant: 3 ACH50 (MN code?)
 - Tight: 0.6 ACH50 (Passive House)

| ACH50 | Exterior | Interior | Floor/Ceiling | Door |
|-------|----------|----------|---------------|------|
| 9.5 | 43% | 34% | 13% | 9% |
| 3 | 47% | 18% | 5% | 29% |
| 0.6 | 47% | 18% | 5% | 29% |

Table 1: Leakage distribution used in models

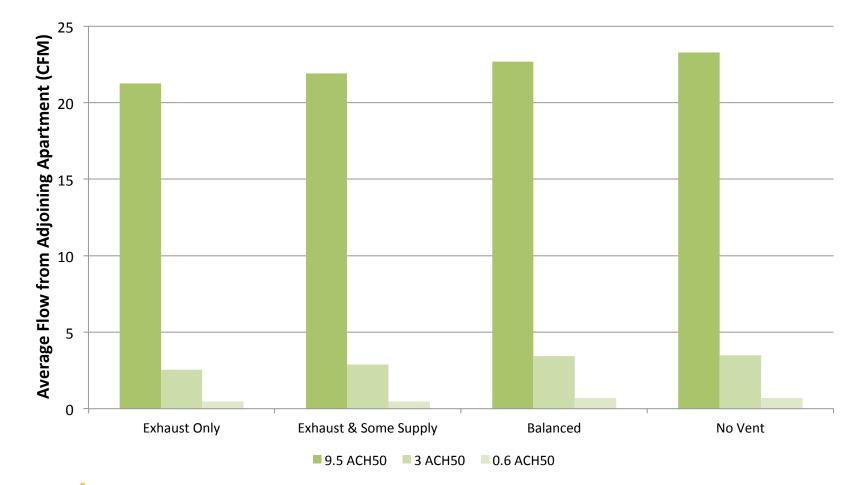

Results – Ventilation Flows

Results – Interior Flows

Center for Energy and Environment

Results – Summary Table

 Impact of sealing air leaks in apartment buildings in Minneapolis

| | New Buildings 80% reduction | Existing Buildings 68% Reduction |
|-------------------------------|--------------------------------|-------------------------------------|
| Heating Savings (therms/year) | 60 - 75 | 40 - 200 |
| Heating Savings (\$/year) | \$33 - \$44 | \$23 - \$120 |

Exterior leakage reduced from 3.0 ACH50 to 0.6 ACH50

Low savings: Total leakage reduced from 9.5 ACH50 to 3 ACH50

Little or negative impact on cooling energy

New construction: balanced ventilation Existing buildings: exhaust only typically acceptable

Convert Blower Door Results to Infiltration?

Air Sealing

- Leaky with no or balanced = divide by 25
- Leaky with exhaust ventilation = divide by 40

Considerations

- Need exterior leakage
- Interior sealing >> less impact on energy
- Depends on type/amount of mechanical ventilation
- Impacted by wind shielding and building height

• Air Sealing at Lower Cost?

Aerosol

- Prep
- Sealing process
- Simultaneous air leakage testing ensures results

Vs.

Manual air sealing

- i.e. caulking/foaming
- Architectural specification
- Labor
- Air leakage test

=> Uncertain results

Conclusions

- Not a solution for <u>large</u> air leak gaps
- When aerosol envelope sealing can be used
 - New construction
 - Rehab
 - Change in occupancy (higher cost)
- New construction
 - 81% reduction & 77% below code
 - Reduce to below code w/o excessive QC
 - Comply with code reliably
- Existing units
 - 68% reduction & 6 of 9 within 15% new code
 - Heating savings= 67 therms/yr, 19%
 - 85% reduction in flows from adjacent units
- Balanced ventilation is crucial for new construction, exhaust or supply OK for existing
- Can you eliminate some "conventional" sealing? If not, too costly?

Future Work

Large Building Sealing with Department of Defense

- Sealing existing commercial buildings on military bases
- Lab testing of seal strength and durability
- Modeling energy savings due to large-building sealing

Building America

- Integrate sealing process into construction schedule
- Work with developers in CA and MN
- Test multiple options

Aeroseal Commercialization

- Has started commercial service (limited)
- Developing contractor network end of 2017

Dave Bohac dbohac@mncee.org Ben Shoenbauer bshoenbauer@mncee.org

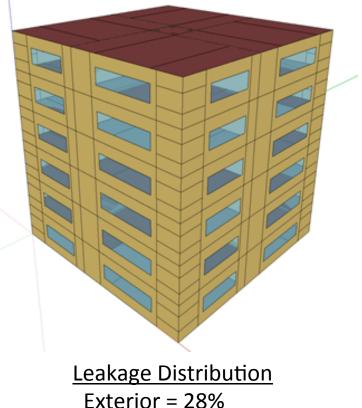

Energy & Ventilation Modeling

- EnergyPlus model: air flows computed from leakage paths and wind/stack/ventilation imbalance
- Three levels of tightness:
 - 9.5 ACH50 (leaky/existing)
 - 3.0 ACH50 (new code)
 - 0.6 ACH50 (aerosol sealed)
- Ventilation systems (0.35ach = 70cfm rqd):
 - balanced
 - exhaust only
 - supply = half of exhaust

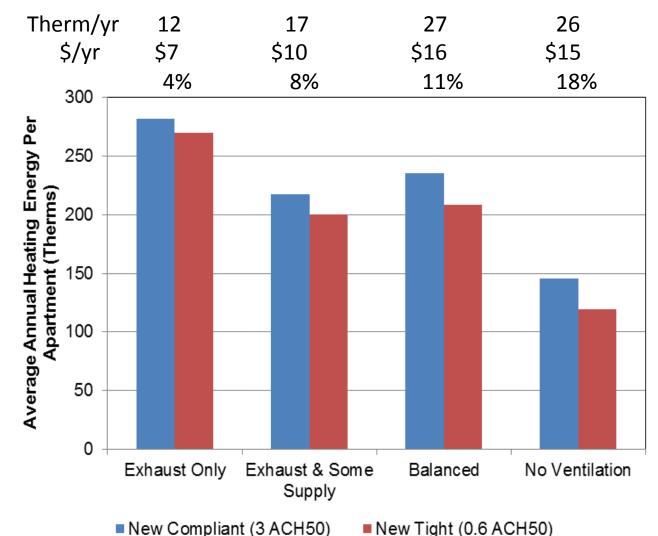

6 story, 4 units/floor 1,200sf/unit

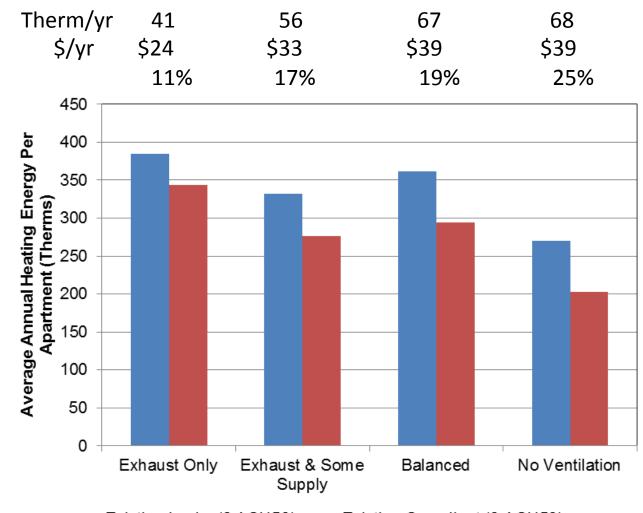

Hallway = 51%Adj Unit = 16%

Ceiling = 5%

Energy & Ventilation Modeling Existing Units

Flow From Adjacent Apartment

85% to 87% Reduction

• Aerosol Sealing Process:

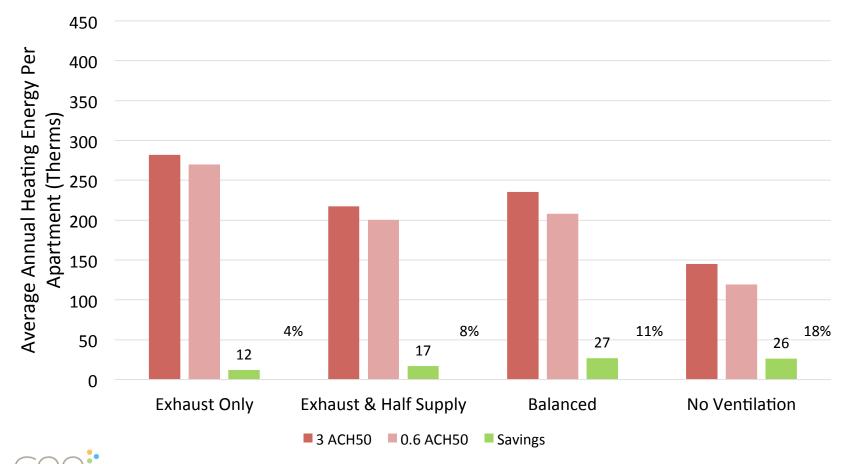

Design Visit – Before Construction

- 1. Identify air tightness goal
- 2. Describe aerosol sealing process
- 3. Review air barrier details
- Specify that leaks with gap width > 3/8" must be sealed or reduced to 3/8"
- 5. Determine when aerosol sealing will be applied in construction process
- 6. Discuss "conventional" sealing that may not be necessary (consider fire code)

This is ideal process
